

Give Steel Carbon footprint 2021

Give Steel carbon footprint includes 3 scopes:

Scope 1

Emissions from fuel use and stationary combustion in Give Steel operations

Scope 2

Mainly emissions from electricity consumption in Give Steel operations

Scope 3

Emissions from outside Give Steel operations

Distribution of emissions 2021

A baseline year

2021 marks the baseline and first year of greenhouse gas emission reporting in Give Steel A/S. Give Steel operations account for approximately 4% of emissions across our full value chain. These in-house emissions are known as Scope 1 and 2 and come from energy used at our factory in Brande and offices in Denmark and Poland. The remaining 96% of greenhouse gas emissions come from activities outside of our own operations (Scope 3). These are primarily from raw materials, distribution of our products and employee commuting.

Every year going forward Give Steel will monitor and report CO₂ emissions in order to track our progress and create more transparency in our operations.

Future goals

At Give Steel we are proud to be the first Danish constructional steel manufacturer that presents a total breakdown of carbon footprint throughout all three scopes.

Although we have reached an important milestone there is still room for improvement. In the coming years Give Steel will be working towards several initiatives that will strengthen our data handling and further improve our sustainability profile.

Working to improve our sustainability, our main targets are:

- Digitalization of tracking origin data for purchased goods.
- Push all suppliers towards use of third-party verified EPDs.
- Replace energy sources with more renewable alternatives where possible.
- Committing to Science Based Target initiative (SBTi).
